Governed weekly compliance view (LIB-03)

Purpose: a mockup of the weekly view a learning operations leader would use during an annual compliance campaign. It shows the numbers they act on, with the definition and data status stated on the page.

Mockup on synthetic data for Tessaly Health, a fictional health system. A layout I designed for this portfolio.

What’s on it and why

Element	Why it’s there
Definition version, as-of date, feed status, check status (header)	A number without its definition and date can’t be compared or trusted. These four facts answer “can I use this?” before anyone reads a figure.
People fully compliant (headline)	The question leaders actually ask. Defined in case study A as M1.
Requirements met	Shows how close the gap is to closing. 81.6% of requirements but 67.3% of people means many people are one module short.
Overdue requirements	The workload. Drives manager follow-up.
Exemptions	Shown beside the rate so the rate can’t be raised quietly by exempting people.
Unresolved accounts	Open data problems that could move the number.
Campaign progress by week	Tells the leader whether to send reminders now or wait.
By facility	Where to focus. One color: the bars compare facilities, they don’t need separate identities.
Most overdue by unit	The follow-up list. Unit managers see names for their own unit only.

All numbers on the mockup are computed from the synthetic data by `analysis/visuals.py`. They match case study A’s governed results exactly; `validate_d.py` checks that.

Why it’s built this way

I limited it to six numbers, because a weekly view that needs explaining every week won’t get read. The header carries the governance (definition, date, freshness, checks), so the trust question is answered in one line instead of a footnote. Rates are paired with the counts behind them, since a rate alone hides how much work is left. The page is static here. In a live BI tool, each tile would link to its definition and every chart would have a table view.

Format: image (PNG and SVG in `outputs/`).
